

- Platform interface is not specific to Scania, when we raise the platform, we cast Scania to every vehicle that passes the HasPlatform() method, the vehicle could be a Transporter. Make separate interfaces.
- Carview X and Y is now public for the bounds() method in Vehicle, could move the method to another class. Or add x and y positions as parameters so that when the method is used in CarController, CarView X and Y can remain private. To also align more with SRP
- Create a separate class ControlPanel for all the buttons.
- In Drawpanel we can handle the loading of the images in a separate class, also the BufferedImage and position where the images start.
